

Are you experiencing tiredness, joint pain or fever following a recent tick bite? Have you developed a rash?

Lyme disease can be unpleasant. It can cause fatigue, fever, joint pain, and other flu-like symptoms, as well as a rash. If you're experiencing any of these common symptoms of Lyme disease following a tick bite, you should see a doctor. You could also consider our clinical research study.

We're looking for men and women who have suspected Lyme disease following a tick bite, and who want to join others to help find out more about this condition.

The clinical research study may be an option for you if:

- you are at least 18 years old
- you have suspected Lyme disease
- you have NOT previously had a Lyme disease vaccination
- you have received ongoing antimicrobial treatment for only two days or less

Other requirements apply. The study doctor will explain these to you.

To find out if this clinical research study is right for you, please contact us at:
